Hoja 4 (d): Modelos lineales con R

Estadística Computacional I. Grado en Estadística

Marta Venegas Pardo

Índice

Ejercicio 1

ANOVA de un factor.

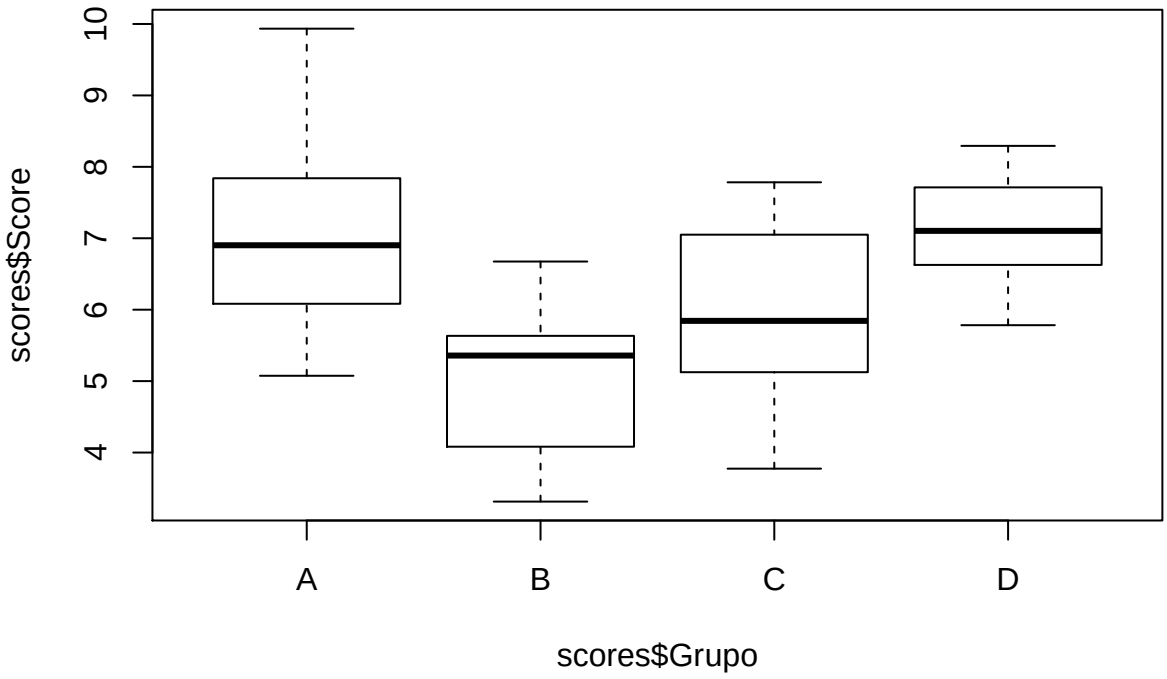
El fichero de datos "scores.txt" contiene la puntuación obtenida en una prueba de nivel de inglés para 40 alumnos. Se han considerado 4 academias, de cada una de las cuales han sido seleccionados aleatoriamente 10 alumnos. Se trata de estudiar si existen diferencias significativas entre las puntuaciones medias dependiendo de la academia.

```
scores=read.table(file="files/scores.txt", header=TRUE)
head(scores)
```

```
##      Score Grupo
## 1 5.786680     B
## 2 5.304995     B
## 3 4.059006     B
## 4 5.547848     B
## 5 4.865416     B
## 6 3.313361     B
```

Lo representamos:

```
boxplot(scores$Score ~scores$Grupo)
```



Nos lo representa para cada grupo.

¿Son significativas las diferencias que vemos gráficamente?

Las medias para cada academia:

```
library(tidyverse)
```

```
## -- Attaching packages --------------------------------------- tidyverse 1.3.1 --
```

```
## v ggplot2 3.3.3     v purrr   0.3.4
## v tibble  3.1.0     v dplyr   1.0.5
## v tidyr   1.1.3     v stringr 1.4.0
## v readr   1.4.0     v forcats 0.5.1
```

```
## -- Conflicts ------------------------------------------ tidyverse_conflicts() --
## x dplyr::filter() masks stats::filter()
## x dplyr::lag()    masks stats::lag()
```

```
scores %>%
  group_by(Grupo) %>%
  summarise(
    Media = mean(Score)
  )
```

```
## # A tibble: 4 x 2
##   Grupo Media
##   <fct> <dbl>
## 1 A      6.97
## 2 B      5.07
## 3 C      5.95
## 4 D      7.10
```

Para estudiar la normalidad:

Test de Shapiro

```
shapiro.test(
  scores %>%
    filter(Grupo =="A") %>%
    select(Score) %>%
    pull())
```

```
##
##  Shapiro-Wilk normality test
##
## data:  scores %>% filter(Grupo == "A") %>% select(Score) %>% pull()
## W = 0.94232, p-value = 0.5791
```

```
shapiro.test(
  scores %>%
    filter(Grupo =="B") %>%
    select(Score) %>%
    pull())
```

```
##
##  Shapiro-Wilk normality test
##
## data:  scores %>% filter(Grupo == "B") %>% select(Score) %>% pull()
## W = 0.9529, p-value = 0.7028
```

```
shapiro.test(
  scores %>%
    filter(Grupo =="C") %>%
    select(Score) %>%
    pull())
```

```
##
##  Shapiro-Wilk normality test
##
## data:  scores %>% filter(Grupo == "C") %>% select(Score) %>% pull()
## W = 0.97104, p-value = 0.9003
```

```
shapiro.test(
  scores %>%
    filter(Grupo =="D") %>%
    select(Score) %>%
    pull())
```

```
##
##  Shapiro-Wilk normality test
##
## data:  scores %>% filter(Grupo == "D") %>% select(Score) %>% pull()
## W = 0.98141, p-value = 0.9723
```

Si aceptamos.

Vamos a hacerlo de una vez:

```
scores %>%
  group_by(Grupo) %>%
  summarise(
    pvalor.shapiro = shapiro.test(Score)$p.value # Le paso el TShapiro a la vble score pero selecciono
```

```
  )
```

```
## # A tibble: 4 x 2
##   Grupo pvalor.shapiro
##   <fct>          <dbl>
## 1 A              0.579
## 2 B              0.703
## 3 C              0.900
## 4 D              0.972
```

Con purrr

```
library(purrr)
scores %>%
  split(.$Grupo) %>%
  map_dbl(~shapiro.test(.x$Score)$p.value)
```

```
##         A         B         C         D
## 0.5791077 0.7028269 0.9003301 0.9722507
```

Aceptamos la Normalidad en las cuatro academias.

Estudiamos la homocedasticidad o igualdad de varianzas.

```
library(car)
```

```
## Loading required package: carData
```

```
##
## Attaching package: 'car'
```

```
## The following object is masked from 'package:dplyr':
##
##     recode
```

```
## The following object is masked from 'package:purrr':
##
##     some
```

```
leveneTest(scores$Score~scores$Grupo, center="mean")
```

```
## Levene's Test for Homogeneity of Variance (center = "mean")
##       Df F value Pr(>F)
## group  3  0.7837 0.5109
##       36
```

Aceptamos la hipótesis de homocedasteceidad.

Podemos aplicar los test paramétricos ANOVA.

```
anova1factor=aov(Score~Grupo , data=scores)
anova1factor
```

```
## Call:
##    aov(formula = Score ~ Grupo, data = scores)
##
## Terms:
##                    Grupo Residuals
## Sum of Squares  27.23780  45.79052
## Deg. of Freedom        3        36
##
```

```
## Residual standard error: 1.127812
## Estimated effects may be unbalanced
```

```
summary(anova1factor)
```

```
##             Df Sum Sq Mean Sq F value   Pr(>F)
## Grupo        3  27.24   9.079   7.138 0.000698 ***
## Residuals   36  45.79   1.272
## ---
## Signif. codes:  0 '***' 0.001 '**' 0.01 '*' 0.05 '.' 0.1 ' ' 1
```

Rechazo H0: medias iguales. Las academias no tienen la misma valoración.

```
cbind(Coef=coef(anova1factor),confint(anova1factor))
```

```
##                  Coef      2.5 %     97.5 %
## (Intercept)  6.971713  6.2484030  7.6950234
## GrupoB      -1.903958 -2.9268735 -0.8810433
## GrupoC      -1.021658 -2.0445735  0.0012568
## GrupoD       0.125106 -0.8978091  1.1480211
```

Coge el grupo A como referencia. El B y C están por debajo mñás de un punto en media, y el D tiene una media muy parecida.

En el grupo B no está el 0, la diferencia es muy significativa. Con los C y D está el 0.

Comparaciones multple: Métodos de Tukey y Ducan

Tukey

```
TukeyHSD(x=anova1factor, conf.level = 0.95)
```

```
##   Tukey multiple comparisons of means
##     95% family-wise confidence level
##
## Fit: aov(formula = Score ~ Grupo, data = scores)
##
## $Grupo
##           diff        lwr        upr     p adj
## B-A -1.9039584 -3.2623485 -0.5455683 0.0031072
## C-A -1.0216583 -2.3800484  0.3367318 0.1976491
## D-A  0.1251060 -1.2332841  1.4834961 0.9945430
## C-B  0.8823001 -0.4760901  2.2406902 0.3140345
## D-B  2.0290644  0.6706743  3.3874545 0.0015414
## D-C  1.1467643 -0.2116258  2.5051545 0.1233214
```

Aceptamos o rechazamos que sean más grandes las medias. Difernecias significativas: B-A y D-B (por los p-valores)

Duncan

```
library(agricolae)
resD=duncan.test(anova1factor,trt="Grupo", console=TRUE)
```

```
##
## Study: anova1factor ~ "Grupo"
##

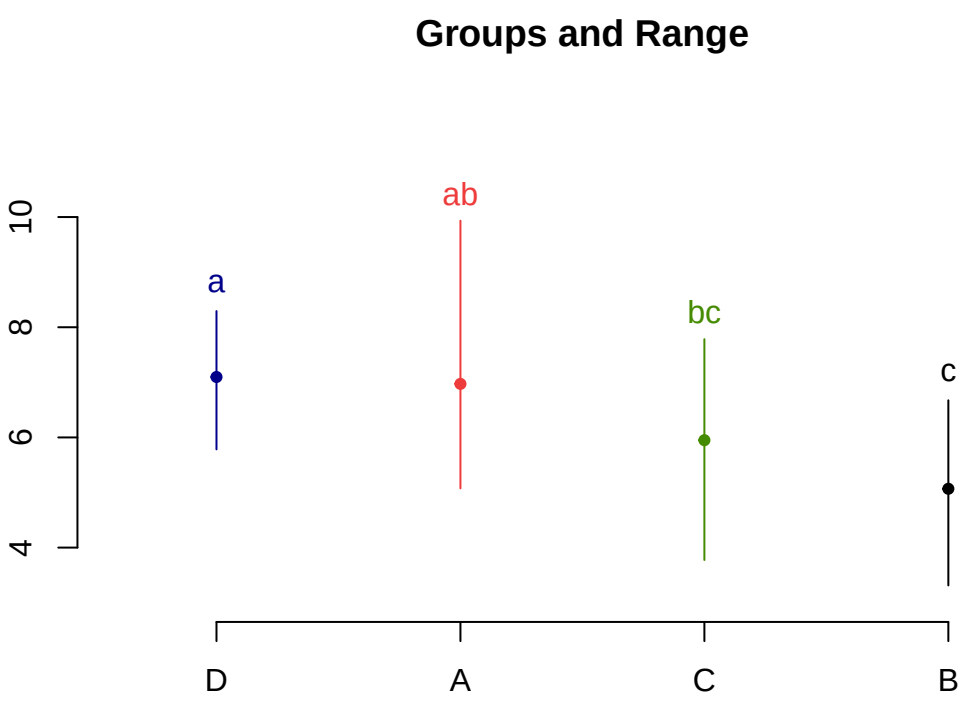
## B 5.067755      c
```

```
plot(resD)
```



Aparecen dos grupos de academias: D-A y C-B.

La estamos viendo de forma ordenada. La mejor media es la D. La A es menor pero podría estar en el mismo grupo. El C viene por detrás y luego por último el B

$$H_0 : \mu_1 = \mu_2 = \mu_3 = \mu_4$$

Si hubiéramos usado la estadística no paramétrica, sería a través de:

```
kruskal.test(scores$Score~ scores$Grupo)
```

```
##
##  Kruskal-Wallis rank sum test
##
## data:  scores$Score by scores$Grupo
## Kruskal-Wallis chi-squared = 14.549, df = 3, p-value = 0.002245
```

Ejercicio 2

ANOVA de dos factores.

A fin de investigar el efecto del fármaco Rhitalin sobre los niños hiperactivos se tomó una muestra de 4 niños para cada uno de los cruces de los dos siguientes factores: Tipo de niño (normal e hiperactivo) y medicamento administrado (Placebo y Rhitalin). Para cada niño se midió un índice de actividad.

Factores: Son variables categóricas Muestras independientes pero para el cruce de dos factores.

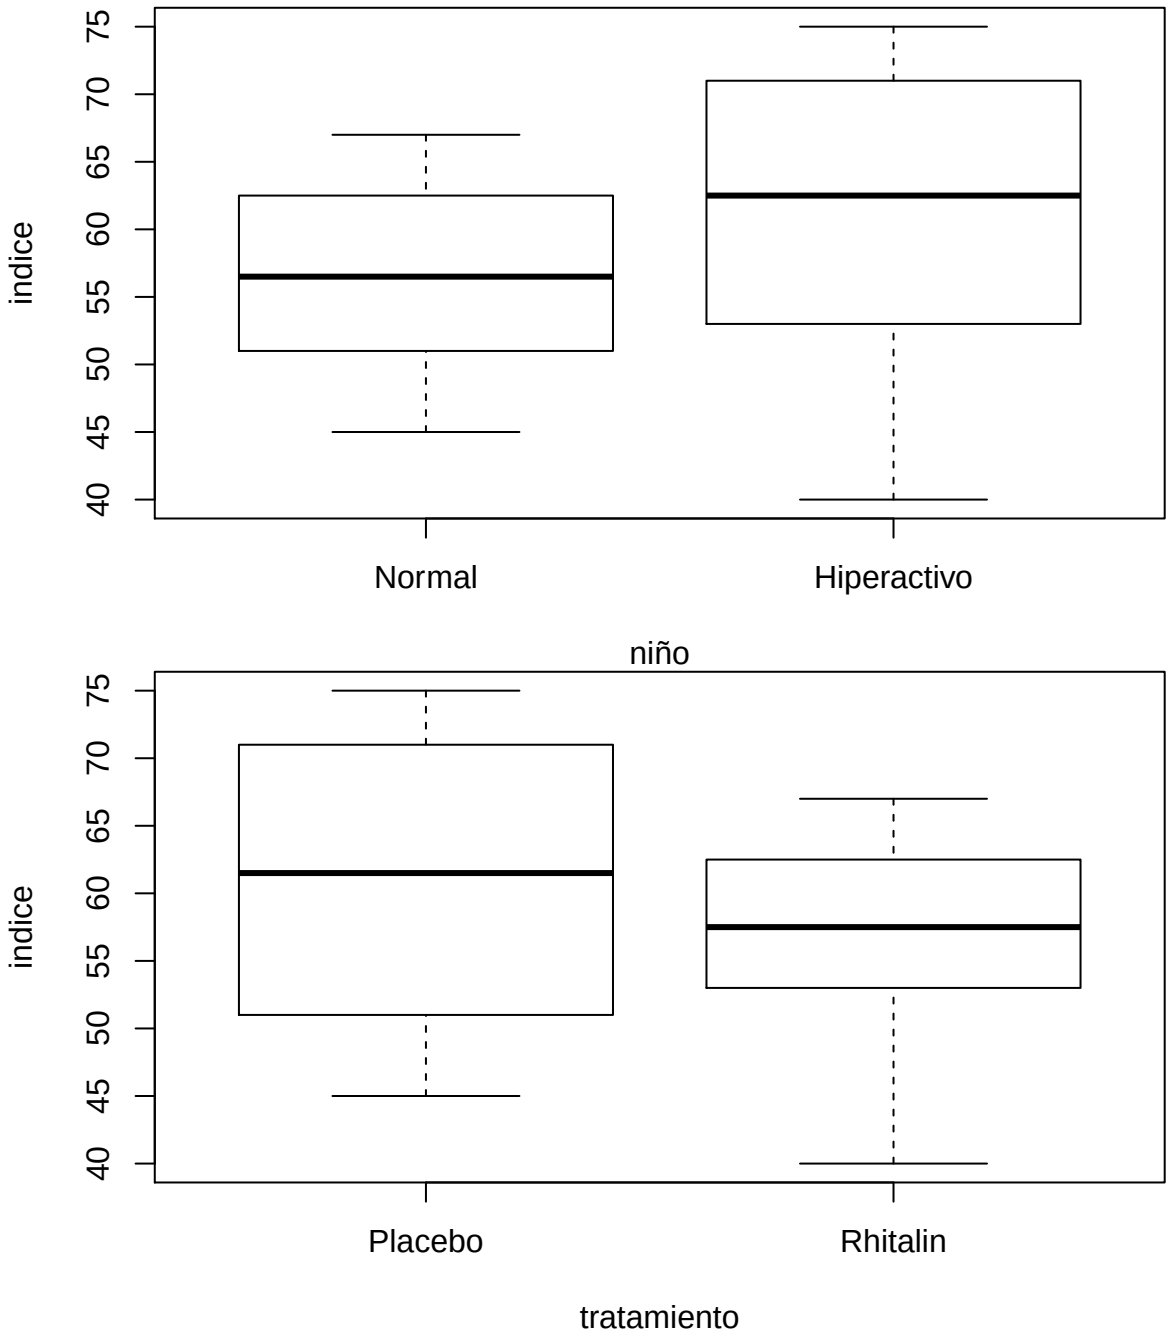
```
indice<-c(50,45,55,52,67,60,58,65,70,72,68,
          75,51,57,40,55)
niño<- gl(2,8)
levels(niño)<- c("Normal","Hiperactivo")
tratamiento<- gl(2,4,16)
levels(tratamiento)<- c("Placebo","Rhitalin")
data.frame(niño,tratamiento,indice)
```

```
##           niño tratamiento indice
## 1       Normal     Placebo     50
## 2       Normal     Placebo     45
## 3       Normal     Placebo     55
## 4       Normal     Placebo     52
## 5       Normal    Rhitalin     67
## 6       Normal    Rhitalin     60
## 7       Normal    Rhitalin     58
## 8       Normal    Rhitalin     65
## 9  Hiperactivo     Placebo     70
## 10 Hiperactivo     Placebo     72
## 11 Hiperactivo     Placebo     68
## 12 Hiperactivo     Placebo     75
## 13 Hiperactivo    Rhitalin     51
## 14 Hiperactivo    Rhitalin     57
## 15 Hiperactivo    Rhitalin     40
## 16 Hiperactivo    Rhitalin     55
```

```
datos2=data.frame(niño,tratamiento,indice)
```

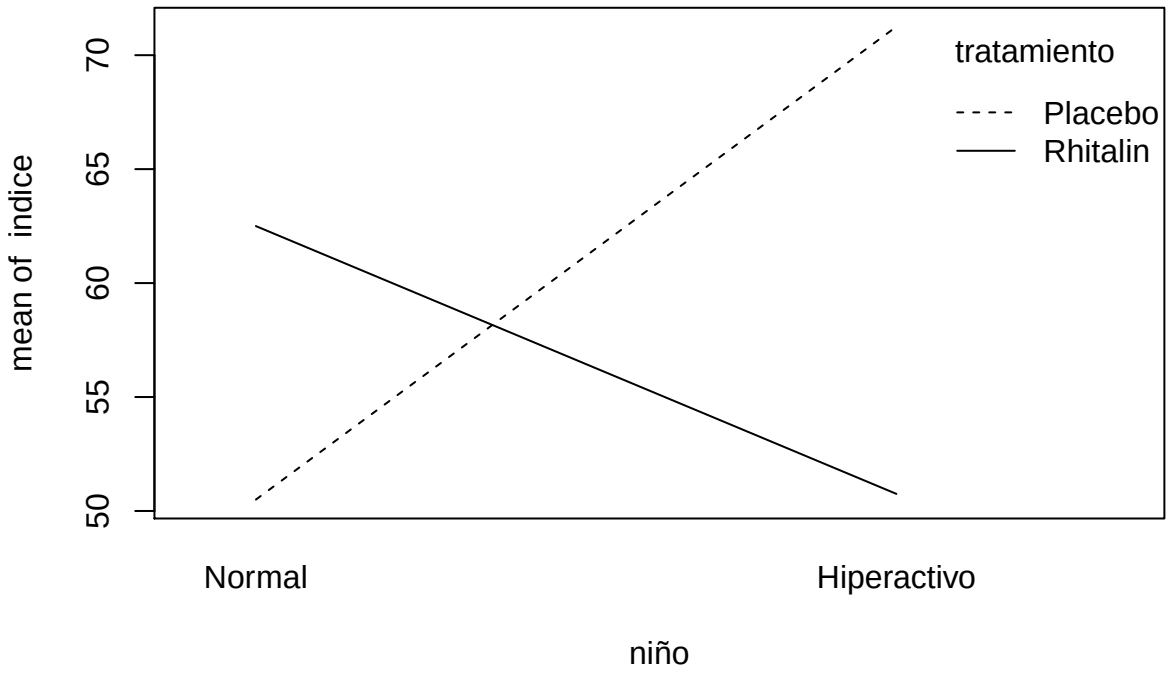
Solución:

```
plot(indice~niño + tratamiento)
```

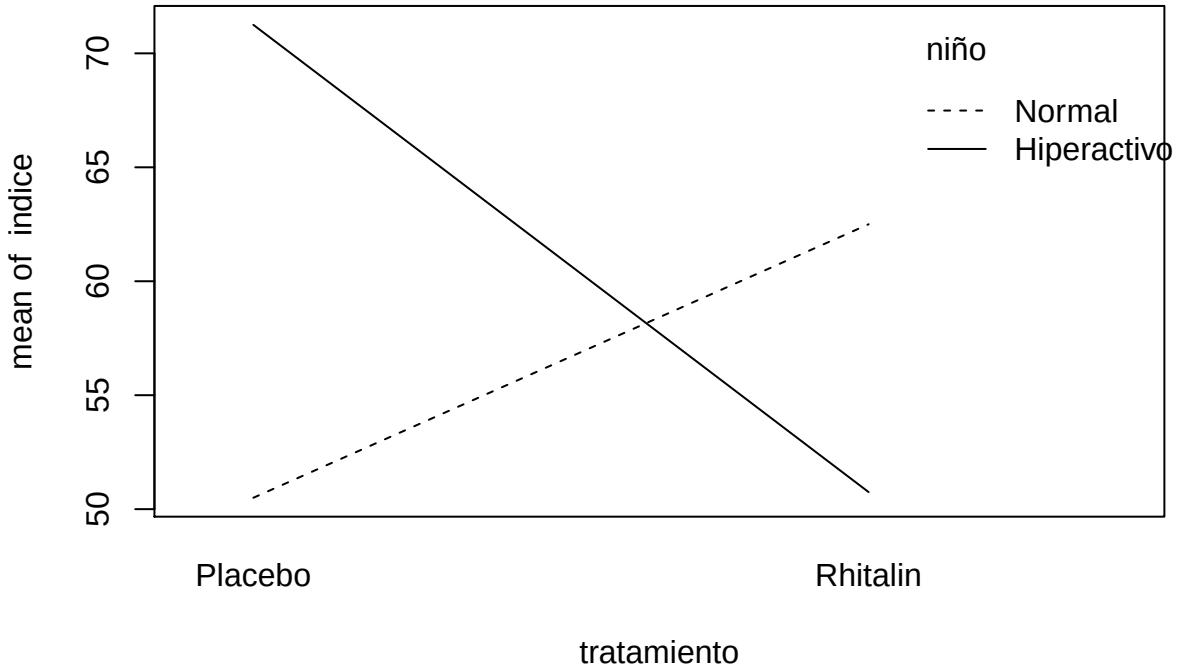


Interacciones:

```
interaction.plot(niño, tratamiento ,indice)
```

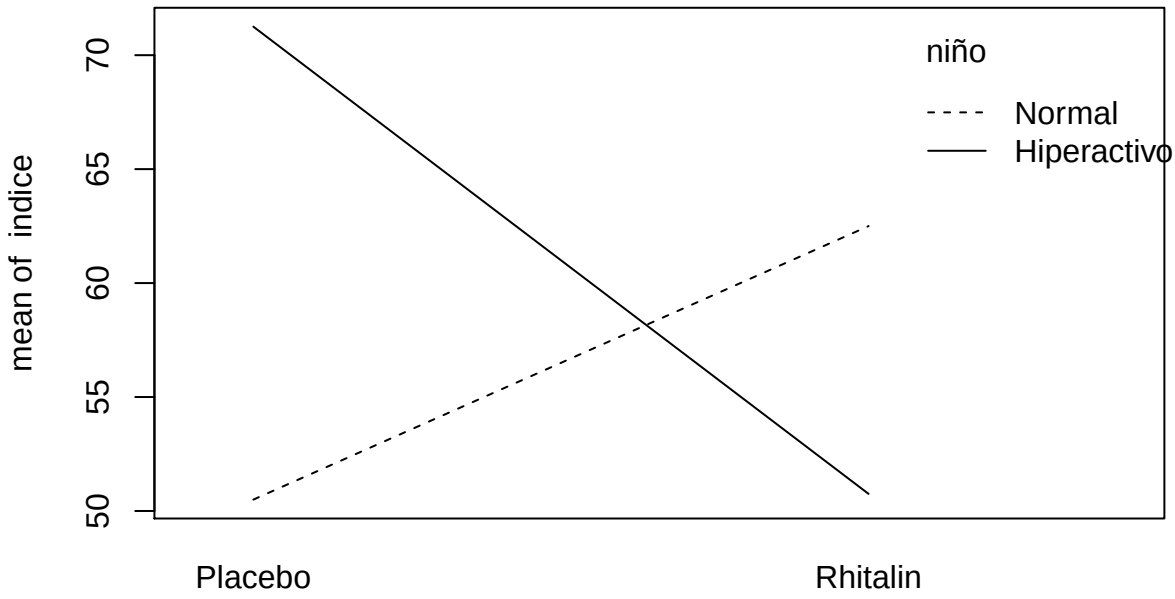


```
interaction.plot(tratamiento,niño ,indice)
```



Vemis que el únduce de hioeractividad aumenta con placebo, pero con el medicamento desciende. Parece que hay relación.

```
interaction.plot(tratamiento,niño ,indice)
```



Interpretar

Test de Anova de dos factores (si es paramétrico)

```
modelo2_factores=lm(indice~niño * tratamiento) # Producto en la fórmula (Le digo que tambien considere
anova(modelo2_factores)
```

```
## Analysis of Variance Table

##
## Residual standard error: 5.046 on 12 degrees of freedom
## Multiple R-squared:  0.7983, Adjusted R-squared:  0.7479
## F-statistic: 15.84 on 3 and 12 DF,  p-value: 0.0001793
```

Estudio las hipotesis

```
shapiro.test(modelo2_factores$residuals)
```

```
##
##  Shapiro-Wilk normality test
##
## data:  modelo2_factores$residuals
## W = 0.94799, p-value = 0.4586
```

Acepto H0. Si rechazo, técnicas no paramétricas.

Ejercicio 3

Regresión Lineal Simple.

```
x <- c(18,23,25,35,65,54,34,56,72,
       19,23,42,18,39,37)
#x=Edad
y <-c(202,186,187,180,156,169,174,172,
      153,199,193,174,
      198,183,178)
#y=Máximo de "frecuencia cardíaca"
```

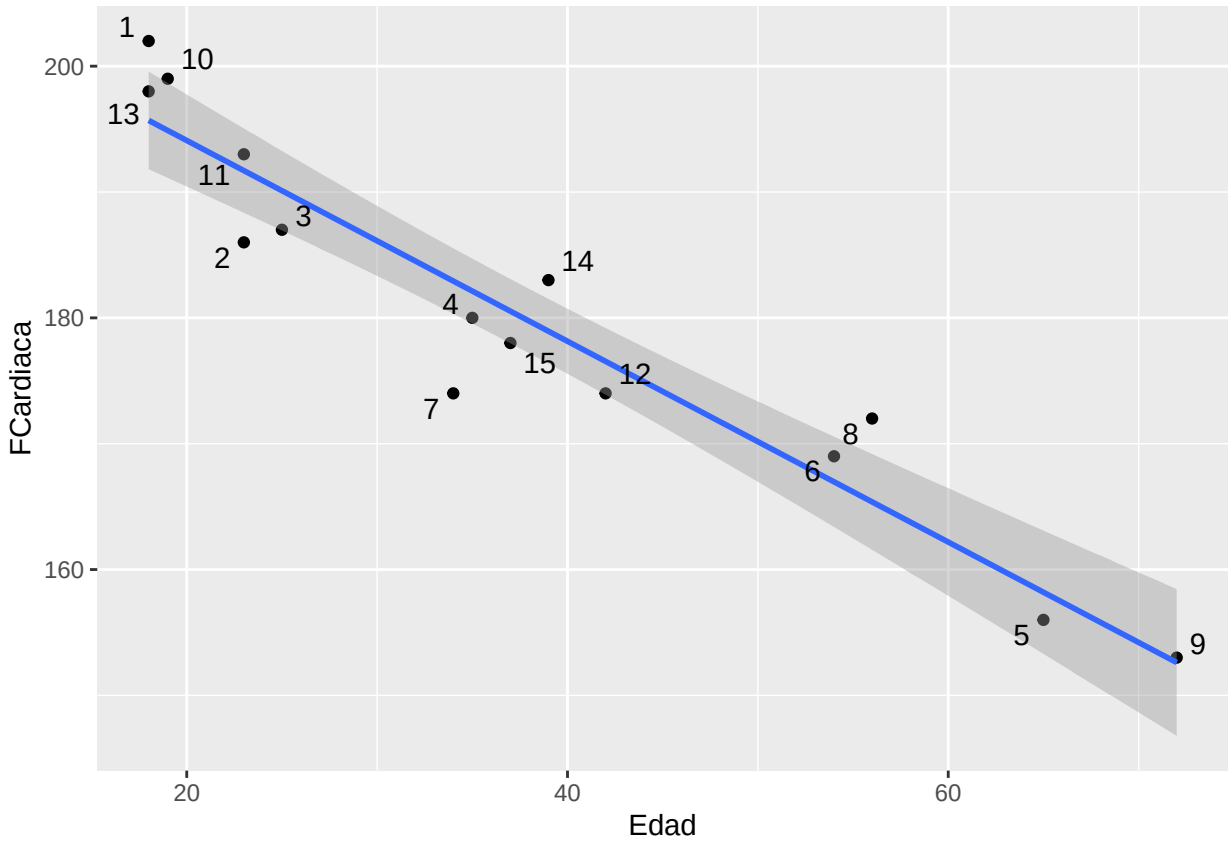
```
library(tidyverse)
library(tibble)
datos3=tibble(Edad=x,FCardiaca=y)
head(datos3)
```

```
## # A tibble: 6 x 2
##    Edad FCardiaca
##   <dbl>     <dbl>
## 1    18       202
## 2    23       186
## 3    25       187
## 4    35       180
## 5    65       156
## 6    54       169
```

Nube puntos y superponer la recta de mínimos cuadrados.

```
library(ggrepel)
datos3 %>%
  ggplot(aes(x=Edad , y=FCardiaca, label=row.names(.)))+
  geom_point() + #Diagrama de dsipersion
  geom_smooth(method="lm")+
  geom_text_repel()
```

```
## `geom_smooth()` using formula 'y ~ x'
```



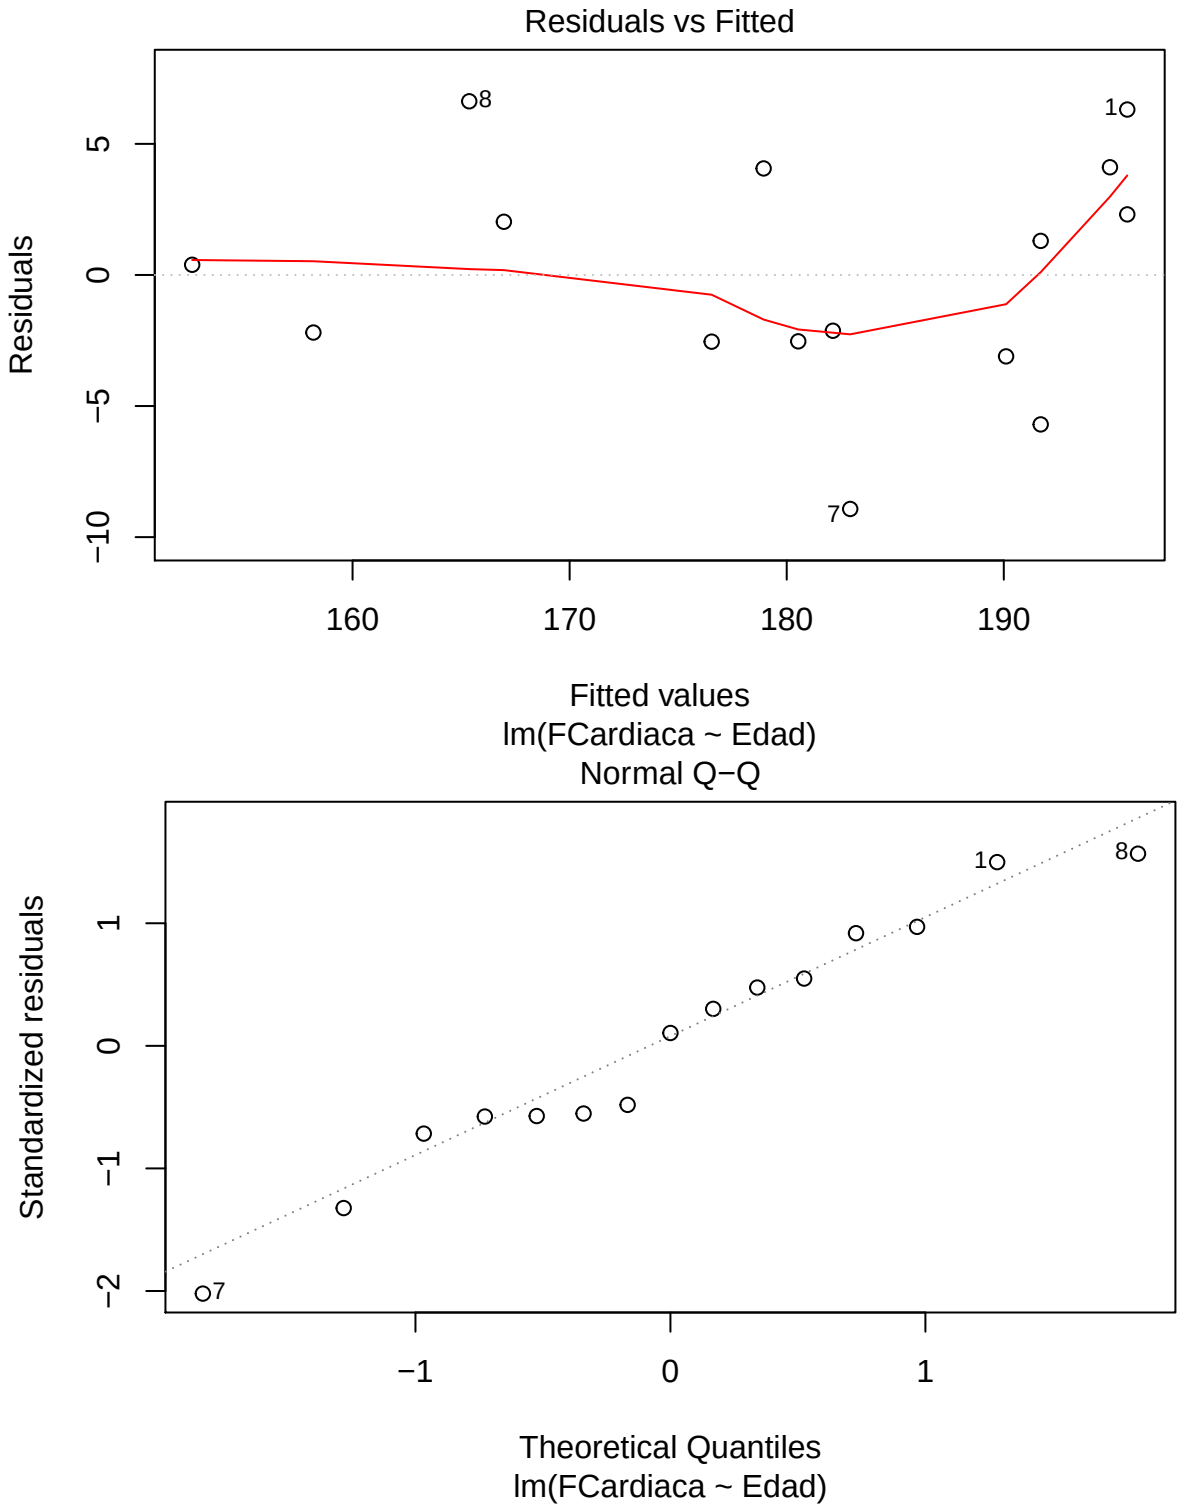
Vamos a obtener el modelo lineal.

```
modelo=lm(FCardiaca~Edad, data=datos3)
summary(modelo)
```

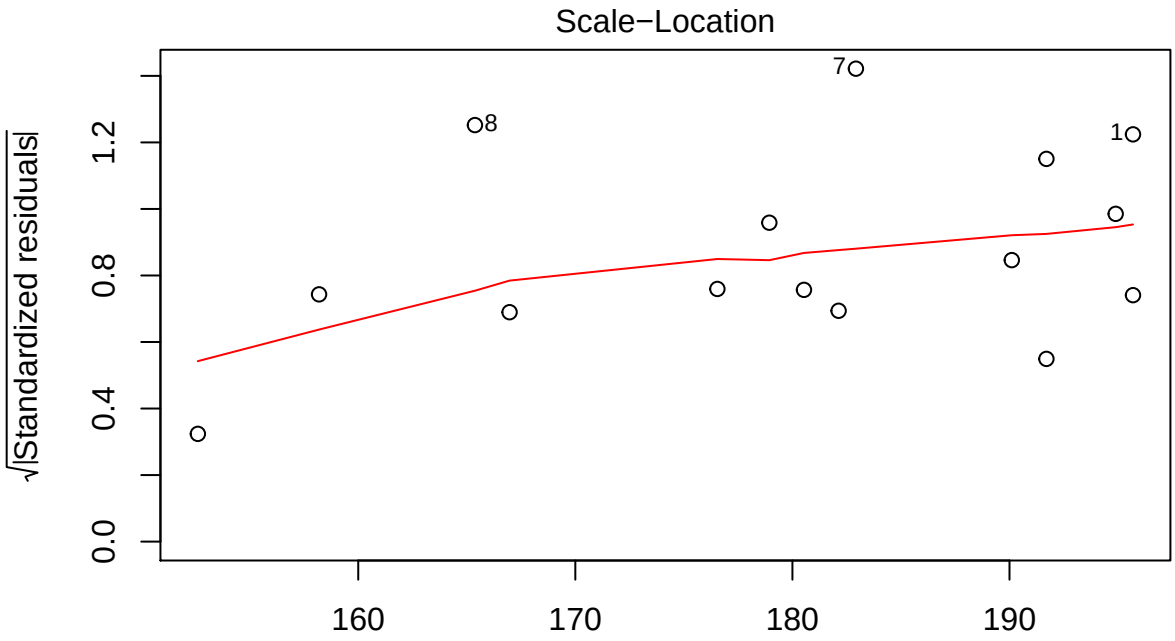
```
##
## Call:
## lm(formula = FCardiaca ~ Edad, data = datos3)
##
## Residuals:
##     Min      1Q  Median      3Q     Max
## -8.9258 -2.5383  0.3879  3.1867  6.6242
##
## Coefficients:
##             Estimate Std. Error t value Pr(>|t|)
## (Intercept) 210.04846    2.86694   73.27  < 2e-16 ***
## Edad         -0.79773    0.06996  -11.40 3.85e-08 ***
## ---
## Signif. codes:  0 '***' 0.001 '**' 0.01 '*' 0.05 '.' 0.1 ' ' 1
##
## Residual standard error: 4.578 on 13 degrees of freedom
## Multiple R-squared:  0.9091, Adjusted R-squared:  0.9021
## F-statistic:   130 on 1 and 13 DF,  p-value: 3.848e-08
```

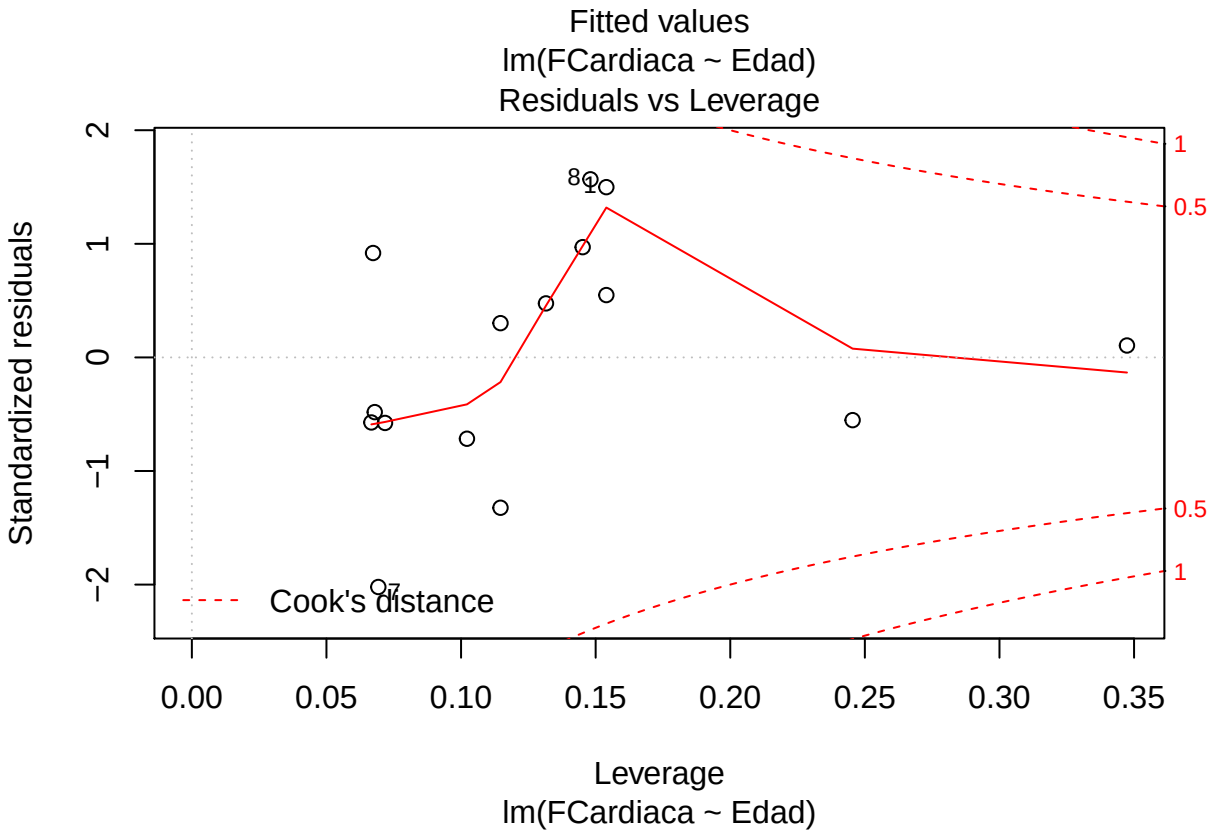
Se puede estudiar el cumplimiento de las hipotesis del modelo de regrsión lineal con ayuda.

```
plot(modelo)
```



Residuals vs Fitted
Residuals
Fitted values
lm(FCardiaca ~ Edad)
Normal Q−Q
Standardized residuals
Theoretical Quantiles
lm(FCardiaca ~ Edad)





Comentar.

El último gráfico estudia la existencia de posibles outliers, parece que no hay ningun punto que se salga de la zona.

Ejercicio 4

Regresión Lineal Múltiple.

```
library(ISLR) #para acceder a Hitters
data(Hitters)
# ?Hitters
summary(Hitters)
```

```

##                  NA's   :59
```

```
dim(Hitters)
```

```
## [1] 322  20
```

Valores NA en el dataset:

```
length(which(is.na(Hitters)))
```

```
## [1] 59
```

Lo que no sabemmos es si es sobre la misma variable o no. Podemos calcular los valores NA para cada columna con sapply

```
sapply(Hitters, function(x) sum(is.na(x)))
```

```
##     AtBat      Hits     HmRun      Runs       RBI     Walks     Years    CAtBat
##         0         0         0         0         0         0         0         0
##     CHits    CHmRun     CRuns      CRBI    CWalks    League  Division   PutOuts
##         0         0         0         0         0         0         0         0
##   Assists    Errors    Salary NewLeague
##         0         0        59         0
```

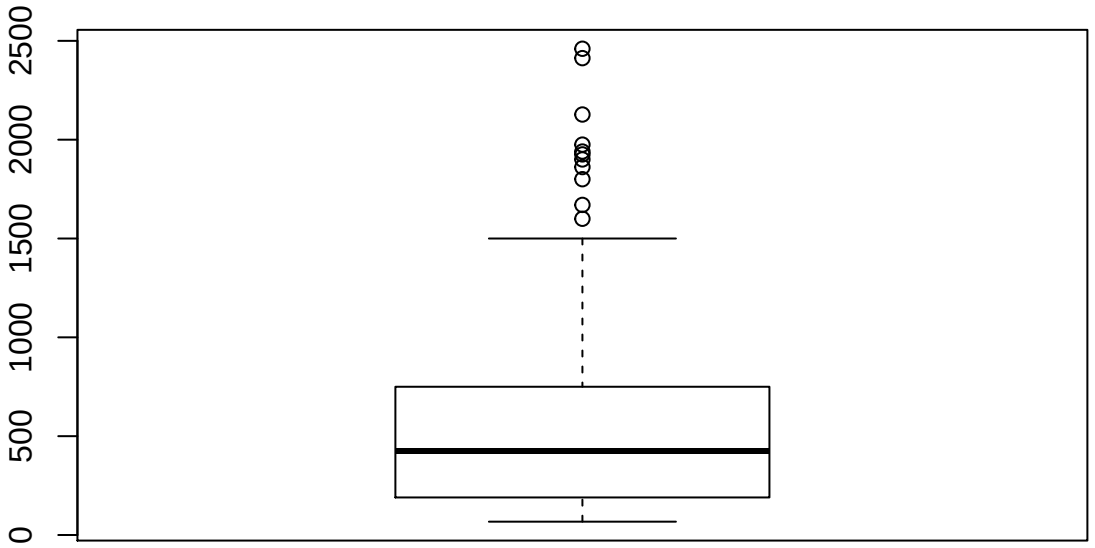
Recorre cada columna y suma los unos que haya. Como vemos únicamente en la variable Salario.

Vamos a trabajar sin las filas que tienen valores NA:

```
Hitters2=na.omit(Hitters)
```

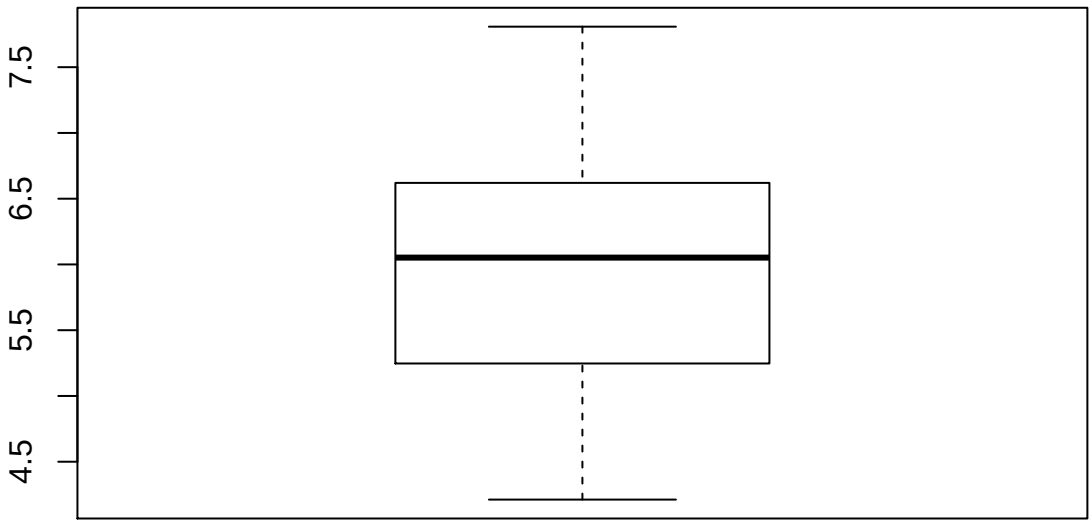
Vamos a realizar un análisis de regresión lineal múltiple sobre la variable Salario (dependiente)

```
boxplot(Hitters2$Salary)
```



Existen vastantes valores outliers, distribución muy asimétrica.

```
boxplot(log(Hitters2$Salary))
```



Decidimos trabajar con la variable transformada (log(Salary))

El modelo que vamos a considerar es:

```
str(Hitters2)
```

```

Ejercicio 5

Regresión Lineal Múltiple.

El fichero de datos "Advertising.csv"" contiene las ventas de un producto en 200 mercados diferentes junto con los presupuestos de publicidad en cada mercado en tres medios: televisión, radio y prensa.

El objetivo es construir un modelo de regresión lineal múltiple para predecir las ventas del producto en función de los gastos en publicidad.

Variables en el archivo: Caso; TV, Radio, Prensa (miles de dólares) y las Ventas (miles de unidades).

Apartado a

Incrementar en mil dólares el gasto publicitario en TV conlleva, por término medio, aumentar en 0.046*1000= 46 unidades las ventas del producto (suponiendo que el gasto publicitario en Radio no cambia).

Si se incrementa en mil dólares el gasto publicitario en la Radio, cabe esperar que las ventas aumenten en 188 unidades, suponiendo fijo el gasto en TV.

Los gastos publicitarios en TV y Radio explican el 89.72 % de la varianza de las Ventas del producto mediante este modelo.

Solución

```
library(readr)
Advertising <- read_csv("files/Advertising.csv")
```

```
##
## -- Column specification --------------------------------------------------------
## cols(
##   Caso = col_double(),
```

```
##   TV = col_double(),
##   Radio = col_double(),
##   Prensa = col_double(),
##   Ventas = col_double()
## )
```

```
dim(Advertising)
```

```
## [1] 200   5
```

```
summary(Advertising)
```

```

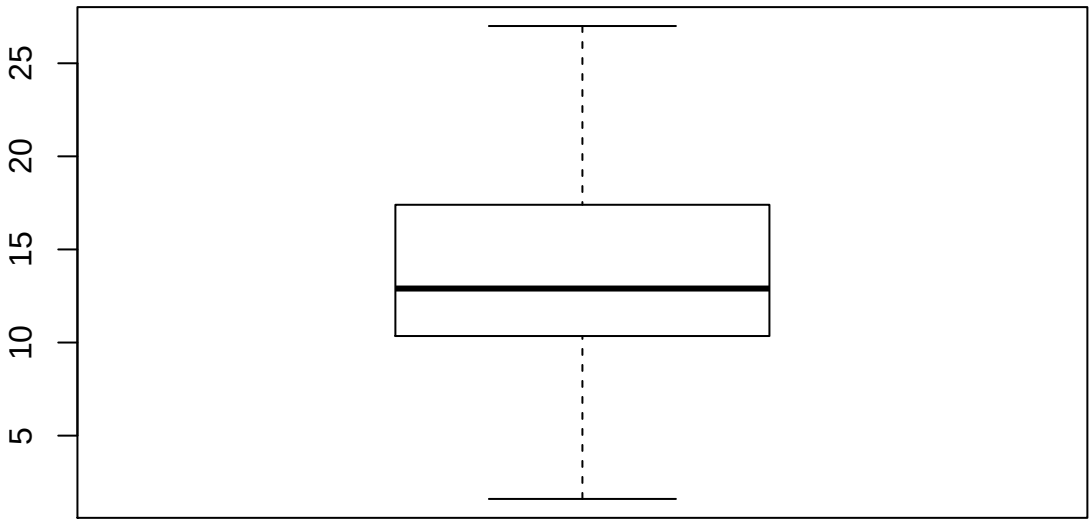
##  Max.   :27.00
```

En este dataset no hay valores faltantes o NA, ya que summary nos lo da.

```
length(which(is.na(Advertising)))
```

```
## [1] 0
```

```
boxplot(Advertising$Ventas)
```



No es necesario utilizar transformaciones de “Ventas”, ya que no existen valores outliers.

El modelo de regresión lineal simple que planteamos:

```
resRML=lm(data = Advertising,formula = Ventas~TV+Radio+Prensa)
summary(resRML)
```

```
##
## Call:
## lm(formula = Ventas ~ TV + Radio + Prensa, data = Advertising)
##

```

Tenemos el mismo R, usarla o no no mejora el comportamiento del modelo lineal.

Para comparar modelos lineales no es conveniente usar el valor de Rcuadrado (tiene en cuenta el número de variables predictoras).

Mejor usar los criterios de información:

- AIC (de Akaike)
- BIC (Bayesiano)

```
AIC(resRML)
```

```
## [1] 782.3622
```

```
AIC(resRML1)
```

```
## [1] 780.3941
```

```
BIC(resRML)
```

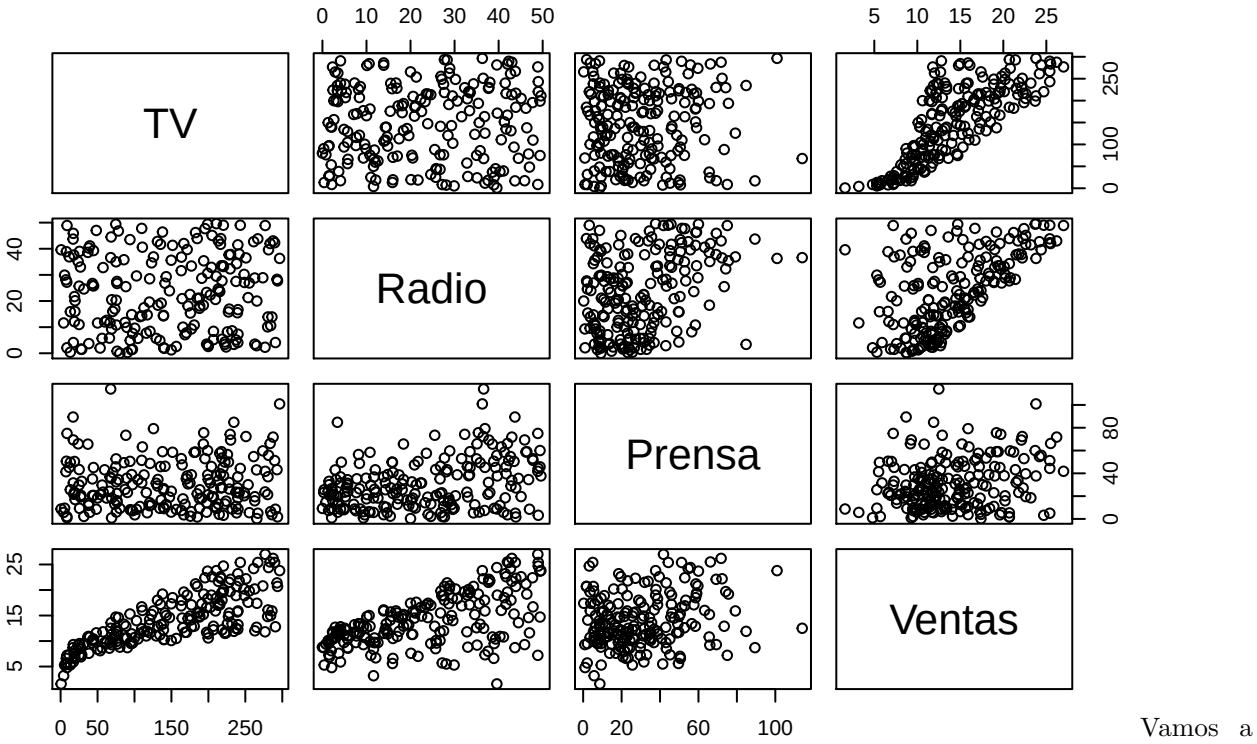
```
## [1] 798.8538
```

```
BIC(resRML1)
```

```
## [1] 793.5874
```

Se observa que el modelo "resMRL1" se comporta mejor según los dos valores, al presentar un valor menor.

```
plot(Advertising[,-1])
```

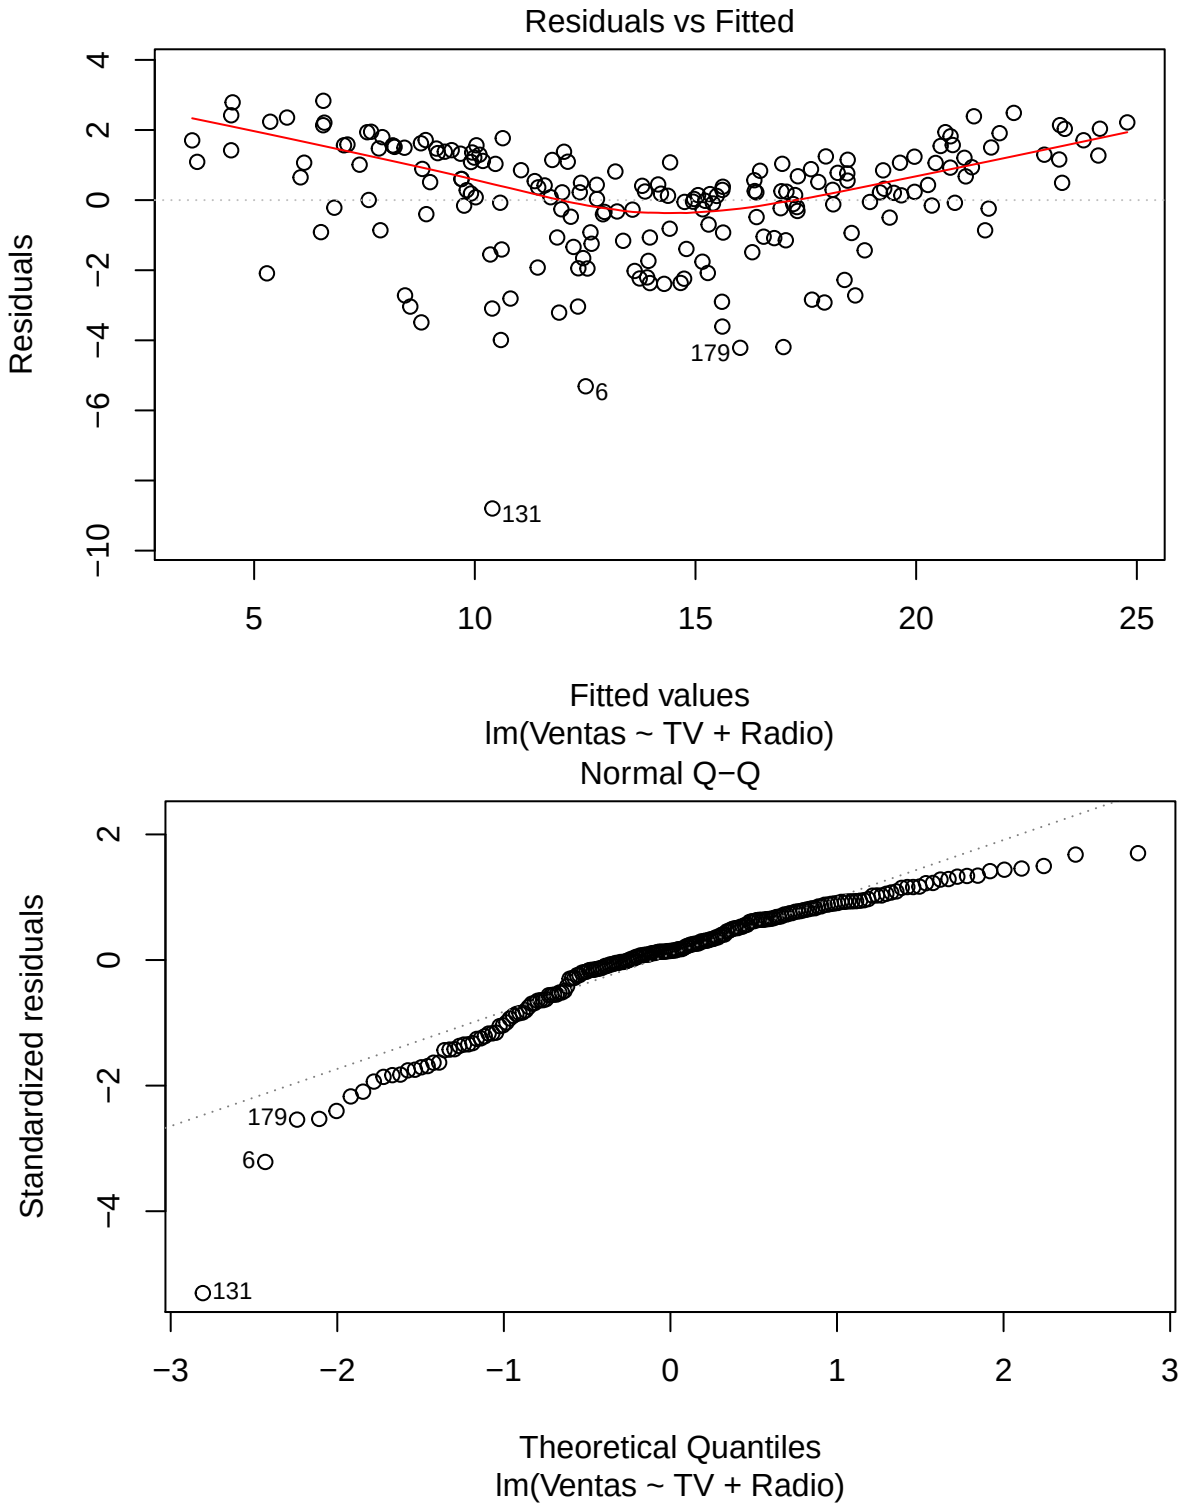


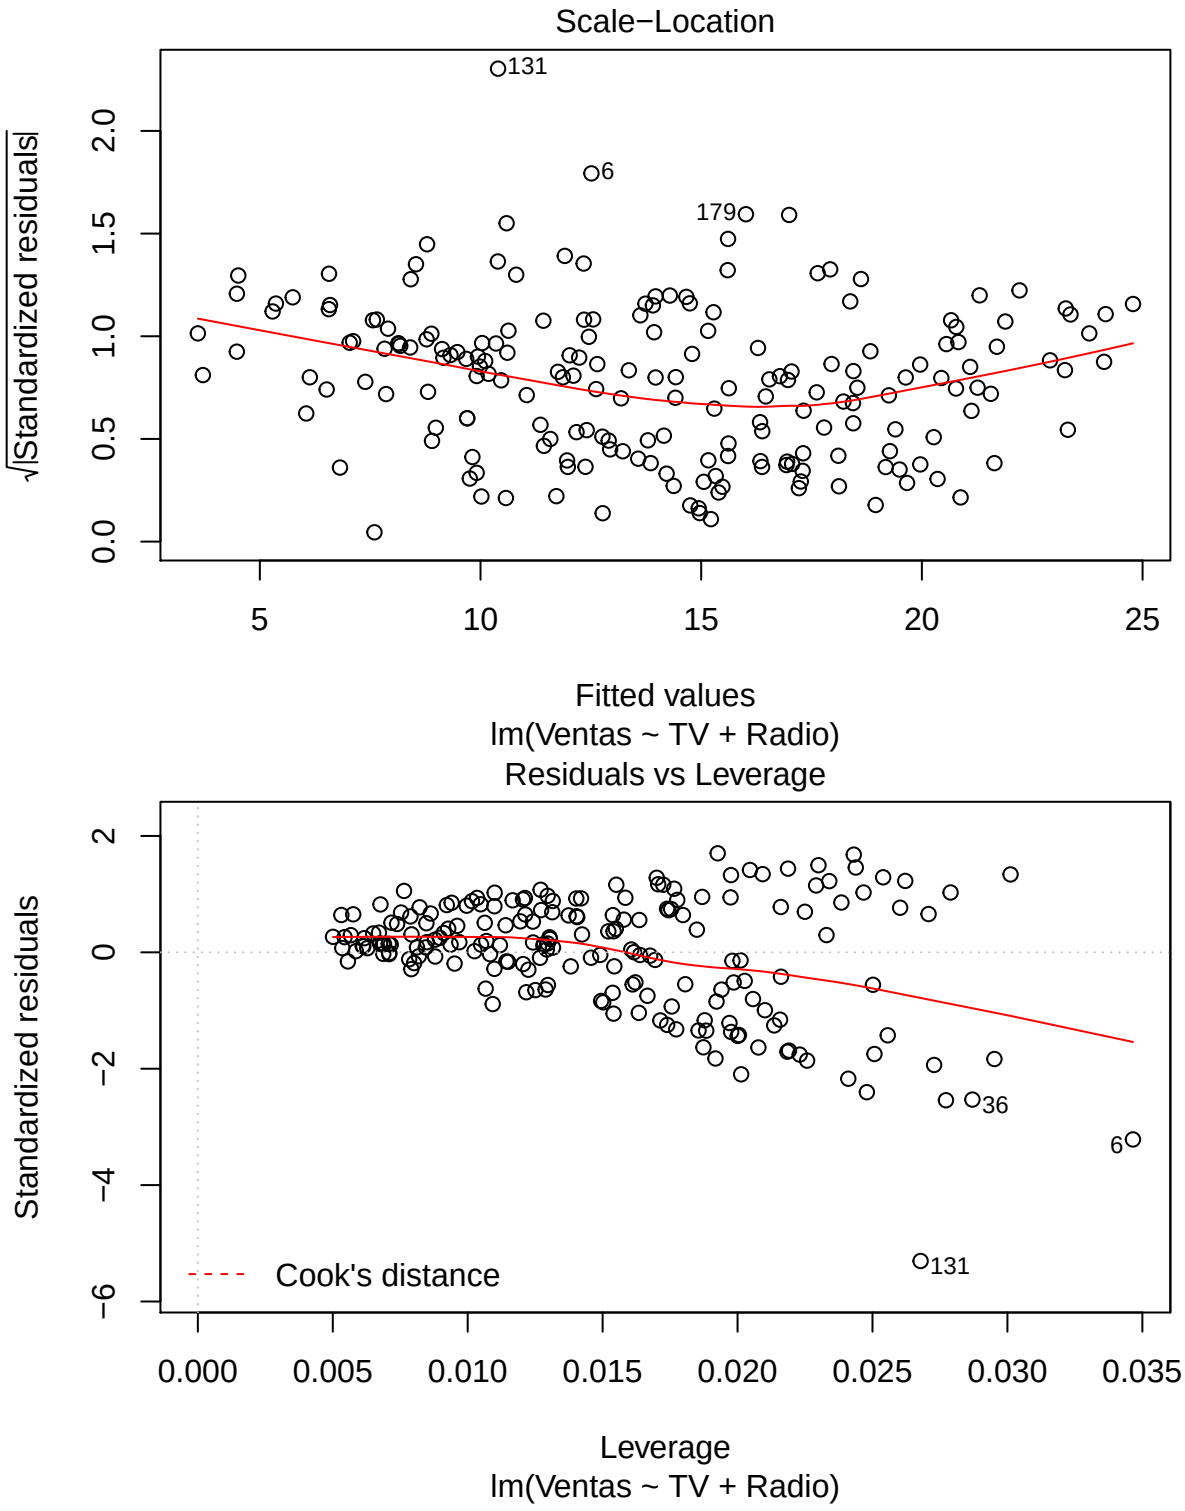
Vamos a ver la correlación

```
cor(Advertising[,-1])
```

```
##                TV      Radio     Prensa    Ventas
## TV     1.00000000 0.05480866 0.05664787 0.7822244
## Radio  0.05480866 1.00000000 0.35410375 0.5762226
## Prensa 0.05664787 0.35410375 1.00000000 0.2282990
## Ventas 0.78222442 0.57622257 0.22829903 1.0000000
```

```
plot(resRML1)
```





Se pueden obtener intervalos de confianza para los coeficientes de regresión:

```
confint(resRML1) # Podemos cambiar el nivel.
```

```
##                 2.5 %     97.5 %
## (Intercept) 2.34034299 3.50185683
## TV          0.04301292 0.04849671
```

```
## Radio       0.17213877 0.20384969
```

Para realizar predicciones:

```
predict(resRML1)
```

```
##         1         2         3         4         5         6         7         8

Ejercicio 6

Regresión cuadrática.

En 1609 Galileo demostró que la trayectoria de un cuerpo cayendo con una horizontal componente es una parábola. En el curso de ganar conocimiento de este hecho, estableció un experimento que midió dos variables, una altura y una distancia, produciendo los siguientes datos.

```
dist = c(253, 337,395,451,495,534,574)
height = c(100,200,300,450,600,800,1000)
```

Solución:

Regresión cuadrática:

```
lm.2=lm(dist~height+I(height^2)) # Añado término de 2 grado.
summary(lm.2)
```

```
##
## Call:
## lm(formula = dist ~ height + I(height^2))
##
## Residuals:
##       1       2       3       4       5       6       7
## -14.420   9.192  13.624   2.060  -6.158 -12.912   8.614
##
## Coefficients:
##               Estimate Std. Error t value Pr(>|t|)
